

Vroomie

GoMechanic Partnership & Investment Brief

Live AI predictive-maintenance product seeking scale capital — and a compatibility study for India's largest independent car-service network

AI predictive maintenance · live product · measured results
github.com/DGeorgeA/vroomie-app · branch main
Live at vroomie.in

All performance figures herein are measured results on held-out data, reproducible with the committed test harnesses.

1 — The gap

GoMechanic knows the car only when it arrives.

Their scale	
Customers	2 M+
Cars serviced	25 L+
Touchpoints in India	1,000+
Rating	4.0 / 1.5 L+ reviews

Three gaps:

- **Service is calendar-based, not condition-based.** A bearing that fails the week after a service goes unnoticed until it's loud, expensive, or roadside.
- **Diagnosis needs the car on-site.** "Car Inspections" is newly listed — intent is there, but answering "*is anything wrong?*" costs a pickup, a bay and a technician hour.
- **Upsell suspicion is visible in their own reviews.** Customers praise "*no surprise additions*", "*only for the job done*". That praise names the fear.

Net: between services, India's largest independent service network receives **zero signal** from the vehicle.

2 — The product

A diagnostic ear in every customer's pocket. Point the phone at a running engine → verdict in ~3 seconds.

- No dongle, no OBD port, **no hardware cost**
- Runs **on the handset** — no per-diagnosis server bill; 1 M checks cost what 1,000 cost
- Mobile web — **no app-store install**
- Live now at vroomie.in

Measured on recordings the system never saw in development:

Metric	Result
Reference recordings identified (5 capture conditions)	42 / 42
Wrong faults named	0
False alarms on speech / TV / music / fan / traffic / silence	0
Healthy cars falsely alarmed	6 / 140 (4.3%)
Real unseen faults detected	~2 in 3
Time to identify	~3 s

Why it doesn't cry wolf: it compares against *healthy* engines as well as faulty ones — so it can answer "nothing wrong". Earlier naive versions flagged a television as a power-steering fault. That failure shaped the architecture.

3 — The transformation

	GoMechanic today	With Vroomie
Service trigger	Calendar, or a fault loud enough to worry	Condition-based — the car schedules the visit
App opened	When service is already needed	Between services , not only before one
Upsell problem	Recommendation comes from the party being paid	Independent finding precedes the quote
Inspection cost	Pickup + bay + technician hour	Free pre-screen ; bay used for confirmed work
Demand visibility	Known at booking	City-level fault signals → forecastable pipeline
Parts planning	Historical averages	Detections hint which parts, which depot

Commercial logic: cars that quietly develop faults between services either fail on the road or reach a competitor first. Every detection is a booking prompt at the moment of concern — and when the customer's own phone flagged it, the workshop's quote reads as confirmation, not a sales tactic.

Data moat: each detection confirmed against what the workshop actually found becomes new training data. GoMechanic's service volume is the asset that compounds accuracy fastest.

4 — Fuel-quality screening

Adulteration and ethanol-blend mismatch are live consumer anxieties in India. Vroomie screens for the engine sounds associated with fuel-quality problems and routes the customer to inspection.

Indicator	Basis
Piston / engine knock	The best-established audible symptom — wrong octane or water-contaminated fuel disturbs combustion timing
Power steering pump whine	Distinct squeal-family acoustic signature
Rocker arm / valve noise	Valvetrain sounds accompanying poor combustion

What it tells the customer: *"Possible relevant indicators detected"* — the sounds found, plus a recommendation to have the fuel system inspected. Every result carries a visible disclaimer that this is AI audio screening, not a laboratory fuel test.

Why the restraint is the product: it never declares fuel contaminated. A tool that cried "contaminated fuel" would be indefensible the first time a lab disagreed. This is what makes it safe for a service network to brand.

Commercially: fuel worry is one of the few reasons a driver checks a car that's running fine — converting diffuse anxiety into a bookable inspection. Admin-controlled; switchable network-wide without a release.

5 — Invested to date, and the ask

Built since August 2025

Capital deployed	₹5 L+
Developer hours	5,000+ (founder + freelancers)
Spend areas	Engineering, freelancers, SEO strategy, digital marketing
External borrowing	₹9 L

Repayment position: investor promised **10% return by 10 September — on track**. Monetization has been slower than planned, so repayment will be funded by a **personal PF withdrawal**. The founder is covering it personally rather than defaulting or delaying.

Traction & IP

- Live product with active users — including a **small user base in Europe** (unpaid, organic)
- **Patent filed — provisional phase**

What scale requires

Detection currently runs on-device. Scaling to continuous monitoring, faster model iteration and a growing reference library needs dedicated AI infrastructure. **Cloud GPU is being implemented now and is not yet stable** — it is the binding constraint on the roadmap.

Requirement	Indicative cost (<i>estimate</i>)
Cloud GPU (inference + training)	₹1.2 – 2.0 L / month
Supporting infra (storage, CDN, DB, monitoring)	₹0.3 – 0.4 L / month
AI engineer × 1 (mid-to-senior, India)	₹1.5 – 2.0 L / month · ₹18 – 24 L / year
12-month total	≈ ₹36 – 53 L

Costs are indicative market estimates, not quoted contracts.

Why now

The algorithm is measured and sound. The binding constraint is **data and compute, not code** — real fault recordings from real vehicles, and stable GPU capacity to iterate on them. A service network partnership supplies the first at scale; this raise supplies the second.

Stated plainly: nine fault families supported today; roughly 1 in 23 healthy cars may see a low-confidence alert; large-scale validation across handset models is the next milestone. Every figure above is reproducible from the automated test suites in the repository.
