

COMPATIBILITY STUDY & PARTNERSHIP PROPOSAL

Vroomie x GoMechanic

Turning 2.5 million serviced cars into 2.5 million continuously monitored cars — using the phone the customer already owns.

AI predictive maintenance · engine v10 · measured results throughout

GoMechanic knows the car only when it arrives.

Formidable at *fulfilling* service. Cannot yet know a car needs service before the customer does.

2M+

Customers served

25L+

Cars serviced

1000+

Touchpoints in India

4.0

Rating · 1.5L+ reviews

GAP 01

Service is time-based, not condition-based

A bearing that fails the week after a service goes unnoticed until it is loud, expensive or roadside.

GAP 02

Diagnosis requires the car to come in

"Car Inspections" is newly listed — intent is there. But answering "*is anything wrong?*" still costs a pickup, a bay and a technician hour.

GAP 03

The trust anxiety is visible in the reviews

Customers praise "*no surprise additions*", "*only for the job done*". That praise names the fear: a recommendation may be a sales pitch, not a finding.

Net: the app is a booking funnel, opened only once the customer has already decided. Between services the network receives **zero signal** from the vehicle.

A diagnostic ear in every customer's pocket.

Point the phone at a running engine. Verdict in ~3 seconds: healthy, or the most likely fault.

1 • Listen

Phone microphone. No dongle, no OBD port, no hardware cost.

2 • Filter

Speech, TV, music and street noise are rejected before any diagnosis.

3 • Compare

Against known faults *and* known healthy engines — so it can say "nothing wrong".

4 • Confirm

The pattern must persist across the session, not flicker once.

5 • Report

Plain-language finding, graded confidence, workshop-ready.

42/42

Reference recordings identified across five capture conditions

0

Wrong faults named

0

False alarms on speech, TV, music, fan, traffic, silence

~3s

To identify a known recording

ZERO MARGINAL COST

Runs entirely on the handset

On-device analysis. No per-diagnosis server bill — a million checks cost what a thousand cost.

ALREADY BUILT

Live, tested, and instrumented

Mobile web, no app-store install. Every session — including failures — records why it concluded what it did.

From fulfilling demand to detecting it.

Same network, same bays, same technicians — reached by customers arriving with evidence instead of suspicion.

DIMENSION	GOMECHANIC TODAY	WITH VROOMIE
Service trigger	Calendar interval, or a fault loud enough to worry the driver	Condition-based — the car's own sound schedules the visit →
Customer relationship	Opened when service is already needed	A reason to open the app between services , not only before one
The upsell problem	Recommendation arrives from the party being paid	Independent finding precedes the quote — the estimate answers a question the customer already had
Inspection cost	Pickup, bay time, technician hour	Free pre-screen ; the bay is used for confirmed work
Demand visibility	Known at booking	Fault signals across a city become a forecastable pipeline
Parts & inventory	Stocked on historical averages	Aggregate detections hint at which parts to hold, where

REVENUE

Converts silent attrition

Cars developing faults between services either fail on the road or reach a competitor first. Each detection is a booking prompt at the moment of concern.

TRUST

Answers the "am I being upsold?" fear

When the customer's own phone flagged it first, the quote reads as confirmation — not a sales tactic.

DATA MOAT

Every check makes it sharper

Detections confirmed against what the workshop found become new training data. GoMechanic's volume is the asset that compounds accuracy fastest.

Listening for the sounds bad fuel makes.

Adulteration and ethanol-blend mismatch are live consumer anxieties in India. Vroomie screens for the engine sounds associated with fuel-quality problems and routes the customer to inspection.

INDICATOR 01

Piston / engine knock

The best-established audible symptom — wrong octane or water-contaminated fuel disturbs combustion timing.

INDICATOR 02

Power steering pump whine

Distinct squeal-family acoustic signature.

INDICATOR 03

Rocker arm / valve noise

Valvetrain sounds accompanying poor combustion.

What it says to the customer

"Possible relevant indicators detected" — the actual sounds found, followed by a recommendation to have the fuel system inspected by a qualified workshop.

Every result carries a visible disclaimer that this is an AI audio screening, not a laboratory fuel test, and that similar sounds have causes unrelated to ethanol.

Why the restraint is the selling point

The feature never declares fuel contaminated. It reports what it heard and sends the car to a technician — which is exactly the behaviour that makes it safe for a service network to put its name on.

A screening tool that cried "contaminated fuel" would be indefensible the first time a lab test disagreed.

For GoMechanic: fuel worry is one of the few reasons a driver checks a car that is running fine — converting diffuse anxiety into a bookable inspection. Admin-controlled; switchable network-wide without a release.

Detection figures measured on held-out recordings the system never saw during development. Current limits stated plainly: nine fault families supported; roughly one in twenty-three healthy cars may see a low-confidence alert; large-scale validation across handset models is the next milestone.
